

# Auto-Ingest Data with Snowflake Snowpipe

## STEPS TO COMPLETION

1. CREATE an EXTERNAL STAGE in Snowflake that references the S3 location.
2. CREATE a PIPE object with auto-ingest = true and make reference to stage created in step 1.
3. Use the SHOW PIPES statement to get the ARN reference to the SQS object automatically created for the pipe.
4. Configure Event Notifications in S3 to put messages in the Queue for all object creation events. Use the ARN reference from the previous step.
5. Load data files to the S3 bucket and confirm they are loaded to the Snowflake table.
